## CVT

**Feature**

While most cars use set of gears to provide most appropriate ratio for given driving situation. Whereas CVT replaces the gears with two variable diameter pulleys a metal belt running between them. One pulley is connected to the engine (input shaft) and the other to the drive wheels (output shaft). The lobes of each pulley are movable, as the pulley lobes come closer together the belt is forced to ride higher on the pulley, effectively making the pulley's diameter larger.

## Slipper Clutch

While high speed riding when gear is shift down a pullback or jerk is experienced that is called engine braking. Slipper clutch reduces the effect of engine braking as braking force is transmitted through the chain drive to the rear wheel causing it to skid or lose traction.
